EXPERIENCE

Software Engineer

One Day Doors & Closets **August 2024 – Present, Roseville, CA**

- **Designed and built the estimating and site-survey system end to end**, from Figma prototypes and specs to rollout: a mobile-first opening builder that checks availability, pricing and shop charges on site, a pricing engine (dealer multipliers, special orders, BOGO, sales tax), estimate versions, and e-signature with payment capture. Used at **87 locations**.
- **Leading the migration of a legacy CodeIgniter application to Laravel**, porting modules incrementally with **no interruption** to live quoting or production operations.
- **Automated franchise onboarding for 87 US locations** with deployment tooling for Google Cloud provisioning, vanity URLs and routing attribution, **cutting setup time by 30%** and standardizing multi-location launches.
- **Rebuilt the Google Calendar API integration for 10,000+ users**, letting franchise owners manage scheduling and sharing in the CRM, and **migrated 100,000+ appointments** off the legacy system with **zero data loss**.
- **Built a full-stack trade partner platform** on Postmark and ActiveCampaign, automating applications and commission tracking for **200 partners generating $400,000+** in revenue.
- **Took over and rebuilt the notification system**: added SMS, per-user channel preferences and a handler layer every new notification type goes through, handling **~100,000 notifications a day** across email, SMS, push and in-app.
- Ship every feature with **documentation, training videos, in-app product tours and release notes**. Currently integrating **Laravel Horizon and Pulse** for queue supervision and performance monitoring.

Site Coordinator

Assist Programs **May 2023 – July 2024, Elk Grove, CA**

- Coached staff on curriculum delivery and ran daily site operations during staff absences, resolving incidents to keep programs running consistently.

PROJECTS

Aera

Solo Engineer · github.com/Calderon1199/Aera · 2026

- Local-first companion for a fitness band: syncs stored history over **Bluetooth LE** into a **Laravel/PostgreSQL** API and dashboard, with no vendor account. Monorepo with a TypeScript decoder, React Native app, Linux CLI and web UI.
- Wrote a **dependency-free TypeScript decoder** for an undocumented binary protocol that runs unchanged on the phone, the server and in CI, validated against an independent reference signal.
- Made syncing **resumable and interrupt-safe** with a state machine that rules out the one ordering that loses data; raw frames are stored append-only so decoded tables can be rebuilt. Documented in five decision records.

The Internets

Solo Engineer · github.com/Calderon1199/TheInternets · 2024

- Reddit-style platform in **React, Redux, Express and PostgreSQL**: 30+ REST endpoints with ownership-based authorization, 7 Sequelize models with migrations, and a multi-stage Docker build.

EDUCATION

Computer Science & Programming

App Academy, Non-Degree Program · San Francisco, CA · 2024

SKILLS

Languages	PHP, TypeScript, JavaScript, SQL
Backend	Laravel, Eloquent, Node.js, Express, REST APIs, queues and webhooks
Frontend	React, Redux, Next.js, React Native, Material UI, styled-components
Data	MySQL, PostgreSQL, Redis, schema design and migrations
Integrations	Google Calendar and Workspace APIs, Twilio, AssemblyAI, Postmark, ActiveCampaign
Tools	Git, Docker, AWS, Cloudflare, Figma
